

SAVE YOUR BEES WITH BVP™

BeesVita Plus™, our patented, all-natural honey bee food supplement, has been successfully field-tested to:

The beauty of BeesVita Plus™ is in its comprehensive nutritional balance. In every bag of all-natural BVP™, there is a fine-tuned ratio of carbohydrates, proteins, amino acids, antioxidants, and essential oils that will **help your honey bees thrive**.

“This product, BeesVita Plus, is the first revolutionary product that we have seen – that I have even felt – that’s made for the bees in 25, 30 years. It boosts their immune system and increases their health which means they’re able to pollinate much better and gather more nectar.”

Philip McCabe, President
International Federation of Beekeepers Association

How To Use: Sprinkle 22.5 grams / 1 oz of BeesVita Plus™ on frames that contain bees every 10 days – we recommend leaving a 5 centimeter / 2 inch margin at each end of the frame. For multiple brood boxes, simply repeat the instructions for each box.

We believe BeesVita Plus™ integrates with existing Varroa treatments and so recommend using Varroa treatments once before winter season and once immediately afterwards. BeesVita Plus™, when used correctly, will do the rest and keep Varroa counts low for the remainder of the year. BeesVita Plus™ must be stored under 70°F/24°C. For optimal results, keep temperatures between 55°F/13°C and 60°F/15.5°C.

Frames of Bees	Cup	Fluid Ounce	Gram
10	1 1/4	10	225
8	1	8	180
6	3/4	6	135
4	1/2	4	90

FIELD TESTING

Over the past three years, we have conducted the largest field trials in beekeeping history. Here are some of the results:

UNIVERSITY OF MARYLAND (USA) *Mar 2015 – Jun 2015*

“Genome Analysis of Honey Bee Nutrition with BVP™”: The University of Maryland conducted a study in which scientists analysed the full transcriptome of the fat bodies of honey bees fed BVP®. UMD analysed the genes expression: Immune genes showed significant improvement under the effect of BVP® with a particular focus on the behavior of the detoxification system. Bees activate their detoxification systems to fight exogenous components such as pesticides. The side effect is that this activation generates molecules, Reactive Oxygen Species (ROX), that can potentially damage the honey bees’ tissues. Under the BVP® effect, bees express fewer of the many genes responsible for the detoxification system, a strong indication that BVP® was helping to detoxify the bees’ systems. No other product for bees ever experienced such results before.

USDA AGRICULTURAL RESEARCH SERVICE (USA) *Aug 2017*

“Lab Trials for BVP™ Antioxidant Capacity”: The United States Department of Agriculture Bee Research Lab in Beltsville, Maryland conducted several tests on BeesVita Plus. This includes a test measuring destructive free radicals in honey bees exposed to pesticide.

Paraquat Pesticide Study: One group was fed a water solution of BeesVita Plus mixed with Paraquat. The other group was given a sugar-water solution mixed with Paraquat. The results showed, “reduced oxidative potential.” In other words, “Bees fed BeesVita Plus and Paraquat showed signs of efficient resistance against the damaging effects of the pesticide compared to bees fed Paraquat in sugar water only,” according to the lead USDA researcher.

Anti-Oxidant Strength: another USDA study demonstrated BVP® has not only 38 times more antioxidant power than other products for bees already in the market, but also shows that BVP® is stronger than vitamins B6, B12 and beta-carotene combined. No other product on the market has shown such standards for anti-oxidative capacity as BVP®. Antioxidants are the key factor to reducing oxidative potential and the damage caused by oxidative stress.

BEE INFORMED PARTNERSHIP (USA) *Dec 2017 – Jan 2018*

“Test of BVP™ Efficacy against Varroa Mite”: Results demonstrated that BVP™ had 45% more efficacy than formic acid (a common treatment currently used to control Varroa).

NATIONAL INSTITUTE OF AGRICULTURAL TECHNOLOGY (ARGENTINA) *Apr 2017 – Sept 2018*

“Comprehensive Multi-site Field Trial of BVP™”: In these studies Bee colonies using BVP resulted to be healthier, living longer and . Including a substantial stimulant effect for bees, giving way to split hives and colony growth. A correlation between the total colony weight and the amount of BVP® consumed was conducted. No trace of the product was detected in the honey or other end products. The extra weight was due to the higher number of brood frames found.

HACETEPPE UNIVERSITY (TURKEY) *Aug 2017 - Sept 2018*

“Comprehensive 10 Site Nationwide Field Trial of BVP™”: Results included extra workforce of bees with amazing benefits in terms of natural control of mites, including in some apiaries a 92.7% eradication of the Varroa mite.

ISTITUTO ZOOPROFILATTICO SPERIMENTALE LAZIO E TOSCANA (ITALY) *Dec 2 Dec 2019*

“Lab Cage Tests and Blind Field Trials to Measure BVP™ Efficacy”: Cage tests showed BVP exercises natural control of mites, including in some of the tests a 100% eradication of the Varroa mite.

BUZZTECH APICULTURE (NEW ZEALAND) *June 2018 - Sept 2018*

“National Field Trial on Brood Growth and Varroa Control”: As well as showing impressive brood growth with the BVP powder, we found starting the season with a patty version can intensify the effect of the nutrient boost at critical times.
